

Forklift Fork Positioners

Forklift Fork Positioner - The fork positioner is actually a hydraulic apparatus which could allow the the one driving to be able to control the forklift without leaving the seat. They are made out of high quality materials and are designed to withstand the most challenging operations and work environments. Side shifting models have the added ability to laterally position the arms or the entire load so as to facilitate much more exact carrying and position in a faster and much more efficient method.

The fork pocket is quite unique and enables the person operating it to be able to securely swing the blades into position without any fear of destroying the positioning cylinders. This could allow the operator the choice to perform independent or simultaneous fork movement, depending on the requirements of the job. For most forklifts with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages could be transformed into fork positioners on available units.
